Erymphocyte Stimulator (ELyS) polypeptides. ELyS is a member of the tumour necrosis factor (TMP) super family and induces B cell twour necrosis factor (TMP) super family and induces B cell trumour necrosis factor (TMP) super family and induces B cell trumour and differentiation. The antibodies of the invention have cytosteatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity of BLyS. The antibodies bind to BLyS inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, theumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP41390-ABP4122B represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           149
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              novel antibodies that immunospecifically bind to

the lymphocyte stimulator (Buy8). The Buy8 gane has been mapped to chromosome 13934 and encodes a protein that is a member of the tumour chromosome 13934 and encodes a protein that is a member of the tumour conference superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scrvs) derived, preferably, from the variable conformation of sich immune, rat or monkey Buy8. The present thereof, of either human, murine, rat or monkey Buy8. The present invention refers to the use of such antibodies in various methods conformation refers to the use of such antibodies in various methods conformation or inappropriate function of Buy8 or its receptor. As such, these compositions are useful for identifying immune disorders conforming mysethenia gravis and multiple sclerosis, infectious disorders disorders e.g. asthma and rheumatoid arthritis, infectious disorates as AIDS and proliferative disorders including leukaemia, carcinoma and conformant Accordingly, they can be described as exhibiting various cotivities such as antirheumatic, antiallergic and cytostatic. This antiinflammatory, antiasthmatic, antiallergic and cytostatic. This cinvention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format cytostatic from WIPO at ftp.wipo.int/pub/published pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   69

BLyS is a member of the tumour necrosis factor (TNP) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS

and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be administered with aberrant expression of BLyS. They may also be administered to treat diseases associated with aberrant BLyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (BLOS)). ABP43990-ABP41228 represent the antibodies and fragments of the antibodies described in the method of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              69

proliferation and differentiation. Specifically, it refers to single chain antibody molecules (screw) derived, preferably, it refers to single chain antibody molecules (screw) derived, preferably, it from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment thereof, of either human, murine, rat or monkey BLyS. The present invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aberrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including myasthenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and Lymphoma. Accordingly, they can be described as exhibiting various ctivities such as antirheumatic, antiallergic and cytostatic. This colypeptide sequence is a single chain antibody that binds BLyS of the invention. NOTE: The sequence data for this patent did not form part of the princed specification, but was obtained in electronic format circlely from WIPO at ftp.wipo.int/published pct_sequences.

(HUMA-) HUMAN GENOME SCI INC. (CAMB-) CAMBRIDGE ANTIBODY TECHNOLOGY.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides. BLyS is a member of the tumpur necrosis factor (TNF) super family and induces B cell tumour necrosis factor (TNF) super family and induces B cell proliferation and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antirheumatic and antiALDS activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS and so may be used to detect and quantitate the presence of BLyS in biological samples and may be used in this way to diagnose disease associated with aberrant expression of BLyS. They may also be and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lupus erythematosus, rheumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency supdrame (AIDS)). ABP43990-ABP4728 represent the antibodies and fragments of the antibodies described in the method of Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders. Vaughan T, Hilbert D; Claim 1; Page 1540-1541; 3148pp; English Choi GH, Barash SC, the invention Ruben SM,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ઠ
                                                                                                                                                                                                                                                  This invention relates to novel antibodies that immunospecifically bind to B lymphocyte stimulator (BLyS). The BLyS gene has been mapped to Chromosome 1344 and encodes a protein that is a member of the tumour can concess factor superfamily and induces both in vivo and in vitro B cell proliferation and differentiation. Specifically, it refers to single chain antibody molecules (scFx) derived, preferably, from the variable heavy CDR3 region that immunospecifically bind to a polypeptide, or fragment invention refers to the use of such antibodies in various methods for the detection, diagnosis and prognosis of diseases related to the aborrant expression or inappropriate function of BLyS or its receptor. As such, these compositions are useful for identifying immune disorders including mysathenia gravis and multiple sclerosis, inflammatory disorders e.g. asthma and rheumatoid arthritis, infectious diseases such as AIDS and proliferative disorders including leukaemia, carcinoma and luminama. Accordingly, they can be described as exhibiting various cartivities such as antirheumanic, antiallergic and cytostatic. This attivities such as antirheumatic, antiallergic and cytostatic. This colypeptide sequence is a single chain antibody that binds BLyS of the invention. NoTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format con the printed specification, but was obtained in electronic former.
                                                                                                                                               Novel antibody that immunospecifically binds to a B lymphocyte stimulator (BLys), useful for detecting and treating diseases or disorders e.g. rheumatoid arthritis, asthma and leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; immunoglobulin; Ig; transgenic; non-human mammal;

transgenic Xenomice, created using the method of the invention. The predictation describes a transgenic non-human mammal which has genome predictation describes a transgenic non-human mammal which has genome modifications that comprise an inactivated endogenous immunoglobulin [Ig] locus, so that the mammal does not display normal B-cell development. The modified genome also has an inserted human heavy chain Ig locus in germline configuration, the human heavy chain Ig locus in modified genome also here, and human N-H genes and an inserted human kappa ight chain Ig locus in germline configuration, the human X-H genes and an inserted human kappa light chain Ig locus in germline configuration, the human kappa light chain Ig locus in germline configuration, the human kappa light chain Ig locus where the number of V-H and V-kappa genes, mere the number of V-H and V-kappa genes inserted are selected to restore normal B-cell development in the mammal. The transgenic animals have a near complete human Ig locus, including both a human heavy chain locus and a human kappa light chain locus. They can be used for the production of human antibodies when exposed to particular antigens e.g. when exposed to human IL-8, EGFR or TNF- alpha the mice will produce antibodies to IL-8, EGFR or TNF- alpha respectively
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New transgenic non-human mammals - having an inactivated immunoglobulin locus and a near complete human immunoglobulin locus, used for production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1 GAAATCAATCATAGTGGAAGCACCAACTACAACCCGTCTCTCAAGAGTCGGGCGAGTCAG 60

from DNA of dominant clone 4d76 of B-cells taken from the creebrospinal from DNA of dominant clone 4d76 of B-cells taken from the creebrospinal fluid (CSF) of a multiple sclerosis (WS) parient. Sequences of VH of CSF B-cells were obtained from 4 MS patients (see AAX5316-19). Differences in nucleotide and predicted amino acid (see AAX05691-94) sequences were compared with the closest known germline VH genes; for 4d76, this was RA. The results provided direct evidence that intrathecal clonally expanded e-cells from the CSF of MS patients are hypermutated postgerminal centre antibody-forming or memory lymphocytes that havd undergone antigen selection. This finding implicates an important pathogenic pathway for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1999-276985/23

The invention relates to a peptide or polypeptide comprising an Fv molecule, a construct or fragments or a construct of a fragment with enhanced binding characteristics which selectively and/or specifically binds to a target cell in favour of other cells, where binding is primarily determined by a first hypervariable region and Fv is a single chain Fv (scFv) or a disulfide Fv (dsFv). The peptide, optionally in association with or attached, compled, combined, linked or fused to a pharmaceutical agent, is useful in the manufacture of a medicament, where Human; Fv molecule; hypervariable region; single chain Fv; cytostatic; disulfide Fv; dsFv; scFv; cancer; carcinoma; sarcoma; leukaemia; adenoma; lymphoma; myeloma; blastoma; seminoma; melanoma; acute myeloid leukaemia. 68 GAAATCAATCATAGTGGAAGCACCAACTACAACCCGTCTCTCAAGAGTCGGGCGAGTCAG 60 Novel peptide/polypeptide for cancer therapy has Fv molecule, construct or fragment, or construct of fragment with enhanced binding characteristics so as to selectively bind target cell in favor of other assay kits for determining B-cell or T-cell clonality. This technology allows the establishment of clonal specific RNA library from pathogenic cells in the CNS of patients, which is important for further understanding of the role of antigen(s) in the cause of B-cell clonal expansion, and towards developing antigen specific therapeutic strategy GlulleAsnHisSerGlySerThrAsnTyrAsnProSerLeuLysSerArgValThr---Levanon A; Human Fv molecule hypervariable region related peptide #87. the medicament has activity against a diseased cell, preferably a cancer cell (selected from carcinoma, sarcoma, lawkaemia, adenoma, lymbona, myeloma, blastoma, seminoma, and melanoma, where the leukaemia cell is an acute myeloid leukaemia cell). The peptide is also useful for preparing a composition for use in inhibiting the growth of a diseased or cancer cell. This sequence represents a human Fv molecule hypervariable region related peptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated epitope present on cancer cells and important in physiological phenomena such as cell rolling, metastasis and inflammation, where the epitope is capable of being bound by an antibody, its antigen-binding fragment or its complex comprising at least one
                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                       68
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, antibody, epitope, cancer, tumour, cell rolling, inflammation, metastasis; hypervariable region; autoimmune disease; thrombosis; restenosis; leukaemia; inflammatory disease, cardiovascular disease; myocardial infarction; retinopathic disease; abnormal platelet function; sulphated tyrosine-dependent protein-protein interaction.

antibody or its binding fragment having a first hypervariable region. The disease, thromosis, restenosis, metastasis, growth and/or replication of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, increase in number of tumour or leukaemia cells, cell-matrix, platelet-matrix, platelet to platelet and/or cell-platelet adhesion or aggregation, for increasing mortality of tumour or leukaemia cells, for increasing the susceptibility of diseased cells to damage by anti-disease, anti-cancer or anti-cells in a patient, or in the manufacture of a medicament for the above mentioned purposes. The epitopes are useful for disquosing and treating diseases such as cancer, leukaemia, autoimmune diseases, inflammatory diseases, cardiovaecular diseases such as myocardial infarction, retinopathic diseases and other diseases mediated by abnormal platelet function and diseases caused by sulphated tyrosine-dependent protein.

Protein interactions. This sequence represents a human antibody fragment

The invention describes a meritod of manifest antibody, and appropriate determining region (CDR) from a non-human antibody and appropriate framework sequences (I) of human antibodses. (I) is selected by using canonical CDR structure types of non-human antibody in comparison to germline canonical CDR structure types of human antibodies as the basis for selection, for humanisation. The method is useful for making a humanisation. The method is useful for making a humanised antibody sequence of any subject species to a less immunogenic form suitable for use in an object species. The method is immunogenic form suitable for use in an object species. The method is immunogenic form suitable for use in an object species that retain non-human CDR regions and to provide humanised antibodies that retain high antigen binding with low immunogenicity in humans, without the need for context the need for determining critically important and construction to obtain humanised antibodies with suitable therapeutic properties. The antibody has high affinity and low immunogenicity without need for comparison of tramework sequences to represent a human hand human and human antibodies. This sequence transfer the represents a human hand human need for comparison to represent a human hand non-human and human antibodies. This sequence

Highly stable artificial antibody libraries with super-repertory and

Classifying a B-cell as malignant or normal by isolating a sequence representing an Ig variable region from the B cell, detecting the presence of a glycosylation site and classifying the cell as malignant or The invention relates to a novel artificial single-stranded antibody library with superior-repertory. The library is created by using a CDNA library as template for amplifying a fragment containing the CD1 and CD2 regions of the WH or VL region of immunoglobulin gene and a fragment containing the CD3 region by PCR, respectively, producing WH and VL libraries, transferring into a host, and displaying the single-stranded antibody on a phage surface. An antibody library of the invention is useful as a tool in proteomics and antibody chips and filters, for screening ligands for antigens, and for studying protein-DNA interaction, diagnosis and treating various diseases. The present invention describes a method for classifying a B-cell as malignant or normal comprising: (a) isolating a sequence representing an immunoglobulin (1g) variable region from the B cell; (b) detecting the presence of a glycosylation site; and (c) classifying the cell as malignant or normal on the basis of the presence or absence of a glycosylation site. Also described: (l) treating a patient suffering from or at risk of having lymphoma; (2) screening a patient suffering from cor at risk of having lymphoma; (2) screening for substances capable of inhibiting glycosylation of the lgy variable region of the B cell receptor inhibiting glycosylation of the type found in the germinal centre and N-glycans found on the surface of Ig of lymphoma cells. (S) has glycosylation inhibitor. The method is useful in classifying a B-cell as medicament for treating non-Hodgkin's lymphoma. The present sequence medicament for treating non-Hodgkin's lymphoma. The present sequence represents an Ig variable region sequence which is used in the

The present invention relates to a method for optimizing at least one physico-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least optimized physico-chemical property. The method is useful for optimizing the physico-chemical properties of an antibody, especially the stability, solubility, or antigen blinding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody wariable region sequence used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           GAAATCAATCATGGGAGGGACCAACTACAACCCGTCTCTCAAGAGTCGGGCGAGTCAG 60

```

The present invention relates to a method for optimizing at least one physic-chemical property of an antibody by a computational screening method. The method comprises: receiving a template antibody structure; selecting at least one variable position belonging to the antibody structure; selecting at least one amino acid to be considered at the variable position(s); analyzing the interaction of each selected amino acid at each variable position with at least part of the remainder of the antibody, including the selected amino acids at other variable positions; and identifying a set of at least one antibody sequence with at least optimized physico-chemical property. The method is useful for optimizing the physico-chemical property. The method is useful for optimizing the physico-chemical properties of an antibody, especially the stability, or antigen binding affinity. The optimized antibody may be useful for treating a patient. The present sequence is an antibody wariable region sequence used to illustrate the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ທີ່ດ

Eur. J. Immunol. 21, 2355-2363, 1991
A;Title: Diversity of immunoglobulin heavy chain gene segment rearrangement in B lymphob
A;Reference number: A49028
A;Reterence number: A49028, MUID:92008140; PMID:1915549
A;Accession: B49028
A;Status: prelliminary
A;Molecule type: mRNA
A;Residues: 1-143 <TINA
A;Residues: 1-143 <TINA
A;Residues: 1-143 <TINA
A;Experimental source: X-linked agammaglobulinnemia patients, B lymphoblastoid cell lines
A;Note: sequence extracted from NCBI backbone (NCBIN:64472)
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heteroterramer; immunoglobulin P;15-97/Domain: immunoglobulin homology <IMM>
C;Accession: A49045
